National-Level U.S. Greenhouse Gas Inventory

To learn more about the inventory, visit www.epa.gov/ghgemissions/inventory-us-greenhouse-gas-emissions-and-sinks, or explore the data at <https://cfpub.epa.gov/ghgdata/inventoryexplorer/>.

*Percentages may not add to 100% due to independent rounding and the way the inventory quantifies U.S. territories (not shown) as a separate sector.

Global warming potential (GWP) is defined as the cumulative radiative forcing effects of a gas over a specified time horizon resulting from the emission of a unit mass of gas relative to a reference gas. The GWP-weighted emissions of direct greenhouse gases in the U.S. Inventory are presented in terms of equivalent emissions of carbon dioxide (CO₂), using units of million metric tons of carbon dioxide equivalents (MMT CO₂ Eq.).

Conversion:

1 million metric tons = 10⁶ metric tons = 10⁹ kg. The molecular weight of carbon is 12, and the molecular weight of oxygen is 16; therefore, the molecular weight of CO₂ is 44 (i.e., 12 + [16 × 2]), as compared to 12 for carbon alone. Thus, the weight ratio of carbon to carbon dioxide is 12/44.

Conversion from gigagrams of gas to million metric tons of carbon dioxide equivalents:

$$\text{MMT CO}_2 \text{ Eq.} = \left(\frac{\text{Gg}}{\text{of gas}} \right) \times (\text{GWP}) \times \left(\frac{\text{MMT}}{1,000 \text{ Gg}} \right)$$
